

BASF Aktiengesellschaft

December 18, 2001  
B01/0981US IB/RI/wis/cl**Claims**

1. Method of uptaking, or storing, or releasing, or uptaking and storing, or up-  
5 taking and releasing, or storing and releasing or uptaking, storing and releas-  
ing at least one gas characterized in that the gas is uptaken, or stored, or re-  
leased, or uptaken and stored, or uptaken and released, or stored and released  
or uptaken, stored and released by an agent comprising a metallo-organic  
framework material comprising pores and at least one metal ion and at least  
10 one at least bidentate organic compound, which is bound, preferably coordi-  
nately bound to said metal ion.
2. Method according to claim 1, characterized in that the gas comprises at least  
one of the gases among the group consisting of:  
15 Hydrogen, nitrogen, noble gases, CO, CO<sub>2</sub>, and compounds generating and/or  
delivering these gases.
3. Method according to claim 2, wherein the gas is hydrogen, a hydrogen con-  
20 taining gas mixture, a hydrogen generating or delivering substance, a gas  
mixture comprising at least one hydrogen generating and/or delivering sub-  
stance.
4. Method according to claim 1, characterized in that the metal ion is selected  
25 among ions of elements of groups Ia, IIa, IIIa, IVa to VIIIa and Ib to VIb of  
the periodic table of the elements.

1006147-020102

5. Method according to claim 1, characterized in that the metallo-organic framework material is contacted with at least one capacity-enhancing agent selected from the group consisting of:  
solvents, complexes, metals, metal hydrides, metal alloys, and mixtures of two  
5 or more thereof.

6. Method according to claim 1, characterized in that the bidentate organic compound is selected among substituted or unsubstituted aromatic polycarboxylic acids, which may comprise one or more nuclei; and substituted or unsubstituted aromatic polycarboxylic acids, which comprise at least one hetero-atom  
10 and which may have one or more nuclei.

7. Method according to claim 1, characterized in that the metallo organic framework material comprising pores exhibits a specific surface area, as determined  
15 via adsorption (BET according to DIN 66131) of larger than  $20 \text{ m}^2/\text{g}$ .

8. Device for uptaking, or storing, or releasing, or uptaking and storing, or uptaking and releasing, or storing and releasing, or uptaking, storing and releasing at least one gas, accomodating a metallo-organic framework material, as  
20 defined in claim 1.

9. Device according to claim 8, further including  
a container accomodating the metallo-organic framework material;  
an entrance/exit opening for allowing the at least one gas to enter or exit the  
25 device;  
a gas-tight maintaining mechanism capable of maintaining the gas under pressure inside the container.

10. Fuel cell accomodating the agent according to claim 1.  
30

11. Method of using an an agent comprising a metallo-organic framework

material comprising pores and at least one metal ion and at least one at least bidentate organic compound, which is bound, preferably coordinately bound to said metal ion as for uptaking, or storing, or releasing, or uptaking and storing, or uptaking and releasing, or storing and releasing or uptaking, storing and releasing at least one gas in stationary, mobile and mobile portable applications.

12. Method of using according to claim 11, wherein the applications are power plants, cars, trucks, busses, cell phones, laptops.

13. Method of using a device according to claim 8 for supplying power to power plants, cars, trucks, busses, cell phones, laptops.

14. Method of using the fuel cell according to claim 10 for supplying power to power plants, cars, trucks, busses, cell phones, laptops.
